List 1: Introduction to the expanded use of Lists

Copyright 12/12/06 by Robert D. Pace

I build business models and data models. When I tell people what I do, I get blank stares.

The purpose of this article is to relate my modeling to the familiar list (check list) structure, like the one I take to the grocery store. Lists are the one element common to all aspects of my business modeling. A business model is simply a document of a business's important lists. Once completed, this document can be leveraged to generate almost all the other business documentation, like: strategic plans, profit plans, budgets, and internal and external financial statements. This fancy check list works the same for all types of business. Check Lists: Check lists are used by everybody from sales to production to purchasing to accounting, to management. How are they used? They are used before, during, and after a sale; before during, and after a purchase, before, during, and after a production.

List 2: Business Modeling and Lists: Business models?

Copyright 12/12/06 by Robert D. Pace

I build business models and data models. When I tell people what I do, I get blank stares.

The purpose of this article is to relate my modeling to the familiar check list we take to the grocery store. Lists are one element common to all aspects of my business modeling. Your business model is simply a documentation of your business's important lists. Once completed, this document can be leveraged to generate almost all the other business documentation, such as: strategic plans, profit plans, budgets, forecasts, standards, and internal and external financial statements. Therefore, by speeding up document production, business models can save you money everywhere you use business documents. Whether service or product, this fancy check list works the same for all types of business. Check lists are used by everybody from sales to production to purchasing to accounting, to management. They are used before, during, and after a sale; before during, and after a purchase, before, during, and after a production.

List 3: Graphical Reference Systems

Copyright 12/12/06 by Robert D. Pace

Time, distance, direction, speed, and location are all based on a reference to two points, the north and south poles of the earth. This reference system is a standard to be used for measurement no matter where you are, in the city or in the country, on land or on water, in the air or on the ground, or what you are doing (traveling, planning, or budgeting). Any measurement needs a reference system. Business models and databases are measurements and reference systems, plans and budgets are measurements and reference systems. A good measurement needs a reference system.

List 4: Business Model - An Extended Navigation Model

Copyright 12/12/06 by Robert D. Pace

Business models? When I tell people what I do, I usually get blank stares. I build business models or data models. While business modeling is a new discipline, even when compared to other business modeling, my modeling is unique. Why? To make my modeling affordable for all business, I use a special system of standards. The purpose of this document is to introduce those standards and their relation to check lists and navigation standards. Measurement is just as important in managing a business as it is in navigation.

List 5: Networks

Copyright 12/12/06 by Robert D. Pace

The purpose of this document is to record everything I know about networks. It is not much and I probably will never learn any more. This document just helps me quickly review what I do know.
